

CMSC 313 Lecture 07

- **Short vs Near Jumps**
- **Logical (bit manipulation) Instructions**
 - ◇ AND, OR, NOT, SHL, SHR, SAL, SAR, ROL, ROR, RCL, RCR
- **More Arithmetic Instructions**
 - ◇ NEG, MUL, IMUL, DIV
- **Indexed Addressing: [ESI + ECX*4 + DISP]**
- **Project 2**

Common Instructions

- **Basic Instructions**

- ◇ ADD, SUB, INC, DEC, MOV, NOP

- **Branching Instructions**

- ◇ JMP, CMP, Jcc

- **More Arithmetic Instructions**

- ◇ NEG, MUL, IMUL, DIV, IDIV

- **Logical (bit manipulation) Instructions**

- ◇ AND, OR, NOT, SHL, SHR, SAL, SAR, ROL, ROR, RCL, RCR

- **Subroutine Instructions**

- ◇ PUSH, POP, CALL, RET

Short Jumps vs Near Jumps

- **Jumps use relative addressing**

- ◇ Assembler computes an “offset” from address of current instruction
- ◇ Code produced is “relocatable”

- **Short jumps use 8-bit offsets**

- ◇ Target label must be -128 bytes to +127 bytes away
- ◇ Conditional jumps use short jumps by default. To use a near jump:

JGE NEAR Somewhere

- **Near jumps use 32-bit offsets**

- ◇ Target label must be -2^{32} to $+2^{32}-1$ bytes away (4 gigabyte range)
- ◇ Unconditional jumps use near jumps by default. To use a short jump:

JMP SHORT Somewhere

```
; File: jmp.asm
;
; Demonstrating near and short jumps
;

        section .text
        global _start

_start: nop

        ; initialize

start:  mov     eax, 17           ; eax := 17
        cmp     eax, 42         ; 17 - 42 is ...

        jge     exit           ; exit if 17 >= 42
        jge     short exit
        jge     near exit

        jmp     exit
        jmp     short exit
        jmp     near exit

exit:   mov     ebx, 0           ; exit code, 0=normal
        mov     eax, 1         ; Exit.
        int     080H           ; Call kernel.
```

Logical (bit manipulation) Instructions

- **AND: used to clear bits (store 0 in the bits):**

- ◇ To clear the lower 4 bits of the AL register:

AND	AL, F0h	1101	0110
		<u>1111</u>	<u>0000</u>
		1101	0000

- **OR: used to set bits (store 1 in the bits):**

- ◇ To set the lower 4 bits of the AL register:

OR	AL, 0Fh	1101	0110
		<u>0000</u>	<u>1111</u>
		1101	1111

- **NOT: flip all the bits**

- **Shift and Rotate instructions move bits around**

AND—Logical AND

Opcode	Instruction	Description
24 <i>ib</i>	AND AL, <i>imm8</i>	AL AND <i>imm8</i>
25 <i>iw</i>	AND AX, <i>imm16</i>	AX AND <i>imm16</i>
25 <i>id</i>	AND EAX, <i>imm32</i>	EAX AND <i>imm32</i>
80 /4 <i>ib</i>	AND <i>r/m8</i> , <i>imm8</i>	<i>r/m8</i> AND <i>imm8</i>
81 /4 <i>iw</i>	AND <i>r/m16</i> , <i>imm16</i>	<i>r/m16</i> AND <i>imm16</i>
81 /4 <i>id</i>	AND <i>r/m32</i> , <i>imm32</i>	<i>r/m32</i> AND <i>imm32</i>
83 /4 <i>ib</i>	AND <i>r/m16</i> , <i>imm8</i>	<i>r/m16</i> AND <i>imm8</i> (<i>sign-extended</i>)
83 /4 <i>ib</i>	AND <i>r/m32</i> , <i>imm8</i>	<i>r/m32</i> AND <i>imm8</i> (<i>sign-extended</i>)
20 /r	AND <i>r/m8</i> , <i>r8</i>	<i>r/m8</i> AND <i>r8</i>
21 /r	AND <i>r/m16</i> , <i>r16</i>	<i>r/m16</i> AND <i>r16</i>
21 /r	AND <i>r/m32</i> , <i>r32</i>	<i>r/m32</i> AND <i>r32</i>
22 /r	AND <i>r8</i> , <i>r/m8</i>	<i>r8</i> AND <i>r/m8</i>
23 /r	AND <i>r16</i> , <i>r/m16</i>	<i>r16</i> AND <i>r/m16</i>
23 /r	AND <i>r32</i> , <i>r/m32</i>	<i>r32</i> AND <i>r/m32</i>

Description

Performs a bitwise AND operation on the destination (first) and source (second) operands and stores the result in the destination operand location. The source operand can be an immediate, a register, or a memory location; the destination operand can be a register or a memory location. (However, two memory operands cannot be used in one instruction.) Each bit of the result is set to 1 if both corresponding bits of the first and second operands are 1; otherwise, it is set to 0.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

Operation

DEST DEST AND SRC;

Flags Affected

The OF and CF flags are cleared; the SF, ZF, and PF flags are set according to the result. The state of the AF flag is undefined.

Protected Mode Exceptions

- #GP(0) If the destination operand points to a nonwritable segment.
- If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
- If the DS, ES, FS, or GS register contains a null segment selector.

OR—Logical Inclusive OR

Opcode	Instruction	Description
0C <i>ib</i>	OR AL, <i>imm8</i>	AL OR <i>imm8</i>
0D <i>iw</i>	OR AX, <i>imm16</i>	AX OR <i>imm16</i>
0D <i>id</i>	OR EAX, <i>imm32</i>	EAX OR <i>imm32</i>
80 /1 <i>ib</i>	OR <i>r/m8</i> , <i>imm8</i>	<i>r/m8</i> OR <i>imm8</i>
81 /1 <i>iw</i>	OR <i>r/m16</i> , <i>imm16</i>	<i>r/m16</i> OR <i>imm16</i>
81 /1 <i>id</i>	OR <i>r/m32</i> , <i>imm32</i>	<i>r/m32</i> OR <i>imm32</i>
83 /1 <i>ib</i>	OR <i>r/m16</i> , <i>imm8</i>	<i>r/m16</i> OR <i>imm8</i> (sign-extended)
83 /1 <i>ib</i>	OR <i>r/m32</i> , <i>imm8</i>	<i>r/m32</i> OR <i>imm8</i> (sign-extended)
08 <i>lr</i>	OR <i>r/m8</i> , <i>r8</i>	<i>r/m8</i> OR <i>r8</i>
09 <i>lr</i>	OR <i>r/m16</i> , <i>r16</i>	<i>r/m16</i> OR <i>r16</i>
09 <i>lr</i>	OR <i>r/m32</i> , <i>r32</i>	<i>r/m32</i> OR <i>r32</i>
0A <i>lr</i>	OR <i>r8</i> , <i>r/m8</i>	<i>r8</i> OR <i>r/m8</i>
0B <i>lr</i>	OR <i>r16</i> , <i>r/m16</i>	<i>r16</i> OR <i>r/m16</i>
0B <i>lr</i>	OR <i>r32</i> , <i>r/m32</i>	<i>r32</i> OR <i>r/m32</i>

Description

Performs a bitwise inclusive OR operation between the destination (first) and source (second) operands and stores the result in the destination operand location. The source operand can be an immediate, a register, or a memory location; the destination operand can be a register or a memory location. (However, two memory operands cannot be used in one instruction.) Each bit of the result of the OR instruction is set to 0 if both corresponding bits of the first and second operands are 0; otherwise, each bit is set to 1.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

Operation

DEST DEST OR SRC;

Flags Affected

The OF and CF flags are cleared; the SF, ZF, and PF flags are set according to the result. The state of the AF flag is undefined.

Protected Mode Exceptions

- #GP(0) If the destination operand points to a nonwritable segment.
- If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
- If the DS, ES, FS, or GS register contains a null segment selector.

NOT—One's Complement Negation

Opcode	Instruction	Description
F6 /2	NOT <i>r/m8</i>	Reverse each bit of <i>r/m8</i>
F7 /2	NOT <i>r/m16</i>	Reverse each bit of <i>r/m16</i>
F7 /2	NOT <i>r/m32</i>	Reverse each bit of <i>r/m32</i>

Description

Performs a bitwise NOT operation (each 1 is cleared to 0, and each 0 is set to 1) on the destination operand and stores the result in the destination operand location. The destination operand can be a register or a memory location.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

Operation

DEST NOT DEST;

Flags Affected

None.

Protected Mode Exceptions

#GP(0)	If the destination operand points to a nonwritable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a null segment selector.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

Real-Address Mode Exceptions

#GP	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS	If a memory operand effective address is outside the SS segment limit.

SAL/SAR/SHL/SHR—Shift

Opcode	Instruction	Description
D0 /4	SAL <i>r/m8</i> ,1	Multiply <i>r/m8</i> by 2, once
D2 /4	SAL <i>r/m8</i> ,CL	Multiply <i>r/m8</i> by 2, CL times
C0 /4 <i>ib</i>	SAL <i>r/m8</i> , <i>imm8</i>	Multiply <i>r/m8</i> by 2, <i>imm8</i> times
D1 /4	SAL <i>r/m16</i> ,1	Multiply <i>r/m16</i> by 2, once
D3 /4	SAL <i>r/m16</i> ,CL	Multiply <i>r/m16</i> by 2, CL times
C1 /4 <i>ib</i>	SAL <i>r/m16</i> , <i>imm8</i>	Multiply <i>r/m16</i> by 2, <i>imm8</i> times
D1 /4	SAL <i>r/m32</i> ,1	Multiply <i>r/m32</i> by 2, once
D3 /4	SAL <i>r/m32</i> ,CL	Multiply <i>r/m32</i> by 2, CL times
C1 /4 <i>ib</i>	SAL <i>r/m32</i> , <i>imm8</i>	Multiply <i>r/m32</i> by 2, <i>imm8</i> times
D0 /7	SAR <i>r/m8</i> ,1	Signed divide* <i>r/m8</i> by 2, once
D2 /7	SAR <i>r/m8</i> ,CL	Signed divide* <i>r/m8</i> by 2, CL times
C0 /7 <i>ib</i>	SAR <i>r/m8</i> , <i>imm8</i>	Signed divide* <i>r/m8</i> by 2, <i>imm8</i> times
D1 /7	SAR <i>r/m16</i> ,1	Signed divide* <i>r/m16</i> by 2, once
D3 /7	SAR <i>r/m16</i> ,CL	Signed divide* <i>r/m16</i> by 2, CL times
C1 /7 <i>ib</i>	SAR <i>r/m16</i> , <i>imm8</i>	Signed divide* <i>r/m16</i> by 2, <i>imm8</i> times
D1 /7	SAR <i>r/m32</i> ,1	Signed divide* <i>r/m32</i> by 2, once
D3 /7	SAR <i>r/m32</i> ,CL	Signed divide* <i>r/m32</i> by 2, CL times
C1 /7 <i>ib</i>	SAR <i>r/m32</i> , <i>imm8</i>	Signed divide* <i>r/m32</i> by 2, <i>imm8</i> times
D0 /4	SHL <i>r/m8</i> ,1	Multiply <i>r/m8</i> by 2, once
D2 /4	SHL <i>r/m8</i> ,CL	Multiply <i>r/m8</i> by 2, CL times
C0 /4 <i>ib</i>	SHL <i>r/m8</i> , <i>imm8</i>	Multiply <i>r/m8</i> by 2, <i>imm8</i> times
D1 /4	SHL <i>r/m16</i> ,1	Multiply <i>r/m16</i> by 2, once
D3 /4	SHL <i>r/m16</i> ,CL	Multiply <i>r/m16</i> by 2, CL times
C1 /4 <i>ib</i>	SHL <i>r/m16</i> , <i>imm8</i>	Multiply <i>r/m16</i> by 2, <i>imm8</i> times
D1 /4	SHL <i>r/m32</i> ,1	Multiply <i>r/m32</i> by 2, once
D3 /4	SHL <i>r/m32</i> ,CL	Multiply <i>r/m32</i> by 2, CL times
C1 /4 <i>ib</i>	SHL <i>r/m32</i> , <i>imm8</i>	Multiply <i>r/m32</i> by 2, <i>imm8</i> times
D0 /5	SHR <i>r/m8</i> ,1	Unsigned divide <i>r/m8</i> by 2, once
D2 /5	SHR <i>r/m8</i> ,CL	Unsigned divide <i>r/m8</i> by 2, CL times
C0 /5 <i>ib</i>	SHR <i>r/m8</i> , <i>imm8</i>	Unsigned divide <i>r/m8</i> by 2, <i>imm8</i> times
D1 /5	SHR <i>r/m16</i> ,1	Unsigned divide <i>r/m16</i> by 2, once
D3 /5	SHR <i>r/m16</i> ,CL	Unsigned divide <i>r/m16</i> by 2, CL times
C1 /5 <i>ib</i>	SHR <i>r/m16</i> , <i>imm8</i>	Unsigned divide <i>r/m16</i> by 2, <i>imm8</i> times
D1 /5	SHR <i>r/m32</i> ,1	Unsigned divide <i>r/m32</i> by 2, once
D3 /5	SHR <i>r/m32</i> ,CL	Unsigned divide <i>r/m32</i> by 2, CL times
C1 /5 <i>ib</i>	SHR <i>r/m32</i> , <i>imm8</i>	Unsigned divide <i>r/m32</i> by 2, <i>imm8</i> times

NOTE:

* Not the same form of division as IDIV; rounding is toward negative infinity.

SAL/SAR/SHL/SHR—Shift (Continued)

Description

Shifts the bits in the first operand (destination operand) to the left or right by the number of bits specified in the second operand (count operand). Bits shifted beyond the destination operand boundary are first shifted into the CF flag, then discarded. At the end of the shift operation, the CF flag contains the last bit shifted out of the destination operand.

The destination operand can be a register or a memory location. The count operand can be an immediate value or register CL. The count is masked to 5 bits, which limits the count range to 0 to 31. A special opcode encoding is provided for a count of 1.

The shift arithmetic left (SAL) and shift logical left (SHL) instructions perform the same operation; they shift the bits in the destination operand to the left (toward more significant bit locations). For each shift count, the most significant bit of the destination operand is shifted into the CF flag, and the least significant bit is cleared (see Figure 7-7 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*).

The shift arithmetic right (SAR) and shift logical right (SHR) instructions shift the bits of the destination operand to the right (toward less significant bit locations). For each shift count, the least significant bit of the destination operand is shifted into the CF flag, and the most significant bit is either set or cleared depending on the instruction type. The SHR instruction clears the most significant bit (see Figure 7-8 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*); the SAR instruction sets or clears the most significant bit to correspond to the sign (most significant bit) of the original value in the destination operand. In effect, the SAR instruction fills the empty bit position's shifted value with the sign of the unshifted value (see Figure 7-9 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*).

The SAR and SHR instructions can be used to perform signed or unsigned division, respectively, of the destination operand by powers of 2. For example, using the SAR instruction to shift a signed integer 1 bit to the right divides the value by 2.

Using the SAR instruction to perform a division operation does not produce the same result as the IDIV instruction. The quotient from the IDIV instruction is rounded toward zero, whereas the “quotient” of the SAR instruction is rounded toward negative infinity. This difference is apparent only for negative numbers. For example, when the IDIV instruction is used to divide -9 by 4, the result is -2 with a remainder of -1. If the SAR instruction is used to shift -9 right by two bits, the result is -3 and the “remainder” is +3; however, the SAR instruction stores only the most significant bit of the remainder (in the CF flag).

The OF flag is affected only on 1-bit shifts. For left shifts, the OF flag is cleared to 0 if the most-significant bit of the result is the same as the CF flag (that is, the top two bits of the original operand were the same); otherwise, it is set to 1. For the SAR instruction, the OF flag is cleared for all 1-bit shifts. For the SHR instruction, the OF flag is set to the most-significant bit of the original operand.

SAL/SAR/SHL/SHR—Shift (Continued)**IA-32 Architecture Compatibility**

The 8086 does not mask the shift count. However, all other IA-32 processors (starting with the Intel 286 processor) do mask the shift count to 5 bits, resulting in a maximum count of 31. This masking is done in all operating modes (including the virtual-8086 mode) to reduce the maximum execution time of the instructions.

Operation

```

tempCOUNT  (COUNT AND 1FH);
tempDEST    DEST;
WHILE (tempCOUNT  $\neq$  0)
DO
  IF instruction is SAL or SHL
  THEN
    CF  MSB(DEST);
  ELSE (* instruction is SAR or SHR *)
    CF  LSB(DEST);
  FI;
  IF instruction is SAL or SHL
  THEN
    DEST  DEST  $\ll$  2;
  ELSE
    IF instruction is SAR
    THEN
      DEST  DEST / 2 (*Signed divide, rounding toward negative infinity*);
    ELSE (* instruction is SHR *)
      DEST  DEST / 2 ; (* Unsigned divide *);
    FI;
  FI;
  tempCOUNT  tempCOUNT - 1;
OD;
(* Determine overflow for the various instructions *)
IF COUNT  1
THEN
  IF instruction is SAL or SHL
  THEN
    OF  MSB(DEST) XOR CF;
  ELSE
    IF instruction is SAR
    THEN
      OF  0;
    ELSE (* instruction is SHR *)
      OF  MSB(tempDEST);
    FI;
  FI;
FI;

```

SAL/SAR/SHL/SHR—Shift (Continued)

```

ELSE IF COUNT  0
  THEN
    All flags remain unchanged;
  ELSE (* COUNT neither 1 or 0 *)
    OF  undefined;
FI;
FI;

```

Flags Affected

The CF flag contains the value of the last bit shifted out of the destination operand; it is undefined for SHL and SHR instructions where the count is greater than or equal to the size (in bits) of the destination operand. The OF flag is affected only for 1-bit shifts (see “Description” above); otherwise, it is undefined. The SF, ZF, and PF flags are set according to the result. If the count is 0, the flags are not affected. For a non-zero count, the AF flag is undefined.

Protected Mode Exceptions

#GP(0)	If the destination is located in a nonwritable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a null segment selector.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

Real-Address Mode Exceptions

#GP	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS	If a memory operand effective address is outside the SS segment limit.

Virtual-8086 Mode Exceptions

#GP(0)	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made.

RCL/RCR/ROL/ROR—Rotate (Continued)

Description

Shifts (rotates) the bits of the first operand (destination operand) the number of bit positions specified in the second operand (count operand) and stores the result in the destination operand. The destination operand can be a register or a memory location; the count operand is an unsigned integer that can be an immediate or a value in the CL register. The processor restricts the count to a number between 0 and 31 by masking all the bits in the count operand except the 5 least-significant bits.

The rotate left (ROL) and rotate through carry left (RCL) instructions shift all the bits toward more-significant bit positions, except for the most-significant bit, which is rotated to the least-significant bit location (see Figure 7-11 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*). The rotate right (ROR) and rotate through carry right (RCR) instructions shift all the bits toward less significant bit positions, except for the least-significant bit, which is rotated to the most-significant bit location (see Figure 7-11 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*).

The RCL and RCR instructions include the CF flag in the rotation. The RCL instruction shifts the CF flag into the least-significant bit and shifts the most-significant bit into the CF flag (see Figure 7-11 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*). The RCR instruction shifts the CF flag into the most-significant bit and shifts the least-significant bit into the CF flag (see Figure 7-11 in the *IA-32 Intel Architecture Software Developer's Manual, Volume 1*). For the ROL and ROR instructions, the original value of the CF flag is not a part of the result, but the CF flag receives a copy of the bit that was shifted from one end to the other.

The OF flag is defined only for the 1-bit rotates; it is undefined in all other cases (except that a zero-bit rotate does nothing, that is affects no flags). For left rotates, the OF flag is set to the exclusive OR of the CF bit (after the rotate) and the most-significant bit of the result. For right rotates, the OF flag is set to the exclusive OR of the two most-significant bits of the result.

IA-32 Architecture Compatibility

The 8086 does not mask the rotation count. However, all other IA-32 processors (starting with the Intel 286 processor) do mask the rotation count to 5 bits, resulting in a maximum count of 31. This masking is done in all operating modes (including the virtual-8086 mode) to reduce the maximum execution time of the instructions.

```

Flags Affected

The CF flag contains the value of the bit shifted into it. The OF flag is affected only for single-bit rotates (see “Description” above); it is undefined for multi-bit rotates. The SF, ZF, AF, and PF flags are not affected.

Protected Mode Exceptions

#GP(0)	If the source operand is located in a nonwritable segment.
	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
	If the DS, ES, FS, or GS register contains a null segment selector.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

Real-Address Mode Exceptions

#GP	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS	If a memory operand effective address is outside the SS segment limit.

Virtual-8086 Mode Exceptions

#GP(0)	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS(0)	If a memory operand effective address is outside the SS segment limit.

Figure 7-11. ROL, ROR, RCL, and RCR Instruction Operations

Example using AND, OR & SHL

- Copy bits 4-7 of BX to bits 8-11 of AX

AX = 0110 1011 1001 0110

BX = 1101 0011 1100 0001

1. Clear bits 8-11 of AX & all but bits 4-7 of BX using AND instructions

AX = 0110 0000 1001 0110

BX = 0000 0000 1100 0000

AND AX, F0FFh

AND BX, 00F0h

2. Shift bits 4-7 of BX to the desired position using a SHL instruction

AX = 0110 0000 1001 0110

BX = 0000 1100 0000 0000

SHL BX, 4

3. "Copy" bits of 4-7 of BX to AX using an OR instruction

AX = 0110 1100 1001 0110

BX = 0000 1100 0000 0000

OR AX, BX

More Arithmetic Instructions

- **NEG: two's complement negation of operand**
- **MUL: unsigned multiplication**
 - ◇ Multiply AL with r/m8 and store product in AX
 - ◇ Multiply AX with r/m16 and store product in DX:AX
 - ◇ Multiply EAX with r/m32 and store product in EDX:EAX
 - ◇ Immediate operands are not supported.
 - ◇ CF and OF cleared if upper half of product is zero.
- **IMUL: signed multiplication**
 - ◇ Use with signed operands
 - ◇ More addressing modes supported
- **DIV: unsigned division**

NEG—Two's Complement Negation

Opcode	Instruction	Description
F6 /3	NEG <i>r/m8</i>	Two's complement negate <i>r/m8</i>
F7 /3	NEG <i>r/m16</i>	Two's complement negate <i>r/m16</i>
F7 /3	NEG <i>r/m32</i>	Two's complement negate <i>r/m32</i>

Description

Replaces the value of operand (the destination operand) with its two's complement. (This operation is equivalent to subtracting the operand from 0.) The destination operand is located in a general-purpose register or a memory location.

This instruction can be used with a LOCK prefix to allow the instruction to be executed atomically.

Operation

```
IF DEST  0
  THEN CF 0
  ELSE CF 1;
FI;
DEST  - (DEST)
```

Flags Affected

The CF flag cleared to 0 if the source operand is 0; otherwise it is set to 1. The OF, SF, ZF, AF, and PF flags are set according to the result.

Protected Mode Exceptions

#GP(0)	If the destination is located in a nonwritable segment. If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains a null segment selector.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

MUL—Unsigned Multiply

Opcode	Instruction	Description
F6 /4	MUL <i>r/m8</i>	Unsigned multiply (AX ← AL × <i>r/m8</i>)
F7 /4	MUL <i>r/m16</i>	Unsigned multiply (DX:AX ← AX × <i>r/m16</i>)
F7 /4	MUL <i>r/m32</i>	Unsigned multiply (EDX:EAX ← EAX × <i>r/m32</i>)

Description

Performs an unsigned multiplication of the first operand (destination operand) and the second operand (source operand) and stores the result in the destination operand. The destination operand is an implied operand located in register AL, AX or EAX (depending on the size of the operand); the source operand is located in a general-purpose register or a memory location. The action of this instruction and the location of the result depends on the opcode and the operand size as shown in the following table.

Operand Size	Source 1	Source 2	Destination
Byte	AL	<i>r/m8</i>	AX
Word	AX	<i>r/m16</i>	DX:AX
Doubleword	EAX	<i>r/m32</i>	EDX:EAX

The result is stored in register AX, register pair DX:AX, or register pair EDX:EAX (depending on the operand size), with the high-order bits of the product contained in register AH, DX, or EDX, respectively. If the high-order bits of the product are 0, the CF and OF flags are cleared; otherwise, the flags are set.

Operation

```
IF byte operation
  THEN
    AX ← AL × SRC
  ELSE (* word or doubleword operation *)
    IF OperandSize = 16
      THEN
        DX:AX ← AX × SRC
      ELSE (* OperandSize = 32 *)
        EDX:EAX ← EAX × SRC
    FI;
  FI;
```

Flags Affected

The OF and CF flags are cleared to 0 if the upper half of the result is 0; otherwise, they are set to 1. The SF, ZF, AF, and PF flags are undefined.

IMUL—Signed Multiply

Opcode	Instruction	Description
F6 /5	IMUL <i>r/m8</i>	AX AL □ <i>r/m</i> byte
F7 /5	IMUL <i>r/m16</i>	DX:AX AX □ <i>r/m</i> word
F7 /5	IMUL <i>r/m32</i>	EDX:EAX EAX □ <i>r/m</i> doubleword
0F AF /r	IMUL <i>r16,r/m16</i>	word register word register □ <i>r/m</i> word
0F AF /r	IMUL <i>r32,r/m32</i>	doubleword register doubleword register □ <i>r/m</i> doubleword
6B /r ib	IMUL <i>r16,r/m16,imm8</i>	word register <i>r/m16</i> □ sign-extended immediate byte
6B /r ib	IMUL <i>r32,r/m32,imm8</i>	doubleword register <i>r/m32</i> □ sign-extended immediate byte
6B /r ib	IMUL <i>r16,imm8</i>	word register word register □ sign-extended immediate byte
6B /r ib	IMUL <i>r32,imm8</i>	doubleword register doubleword register □ sign-extended immediate byte
69 /r iw	IMUL <i>r16,r/m16,imm16</i>	word register <i>r/m16</i> □ immediate word
69 /r id	IMUL <i>r32,r/m32,imm32</i>	doubleword register <i>r/m32</i> □ immediate doubleword
69 /r iw	IMUL <i>r16,imm16</i>	word register <i>r/m16</i> □ immediate word
69 /r id	IMUL <i>r32,imm32</i>	doubleword register <i>r/m32</i> □ immediate doubleword

Description

Performs a signed multiplication of two operands. This instruction has three forms, depending on the number of operands.

- One-operand form.** This form is identical to that used by the MUL instruction. Here, the source operand (in a general-purpose register or memory location) is multiplied by the value in the AL, AX, or EAX register (depending on the operand size) and the product is stored in the AX, DX:AX, or EDX:EAX registers, respectively.
- Two-operand form.** With this form the destination operand (the first operand) is multiplied by the source operand (second operand). The destination operand is a general-purpose register and the source operand is an immediate value, a general-purpose register, or a memory location. The product is then stored in the destination operand location.
- Three-operand form.** This form requires a destination operand (the first operand) and two source operands (the second and the third operands). Here, the first source operand (which can be a general-purpose register or a memory location) is multiplied by the second source operand (an immediate value). The product is then stored in the destination operand (a general-purpose register).

When an immediate value is used as an operand, it is sign-extended to the length of the destination operand format.

IMUL—Signed Multiply (Continued)

The CF and OF flags are set when significant bits are carried into the upper half of the result. The CF and OF flags are cleared when the result fits exactly in the lower half of the result.

The three forms of the IMUL instruction are similar in that the length of the product is calculated to twice the length of the operands. With the one-operand form, the product is stored exactly in the destination. With the two- and three- operand forms, however, result is truncated to the length of the destination before it is stored in the destination register. Because of this truncation, the CF or OF flag should be tested to ensure that no significant bits are lost.

The two- and three-operand forms may also be used with unsigned operands because the lower half of the product is the same regardless if the operands are signed or unsigned. The CF and OF flags, however, cannot be used to determine if the upper half of the result is non-zero.

Operation

```

IF (NumberOfOperands = 1)
  THEN IF (OperandSize = 8)
    THEN
      AX ← AL × SRC (* signed multiplication *)
      IF ((AH = 00H) OR (AH = FFH))
        THEN CF = 0; OF = 0;
        ELSE CF = 1; OF = 1;
      FI;
    ELSE IF OperandSize = 16
      THEN
        DX:AX ← AX × SRC (* signed multiplication *)
        IF ((DX = 0000H) OR (DX = FFFFH))
          THEN CF = 0; OF = 0;
          ELSE CF = 1; OF = 1;
        FI;
      ELSE (* OperandSize = 32 *)
        EDX:EAX ← EAX × SRC (* signed multiplication *)
        IF ((EDX = 00000000H) OR (EDX = FFFFFFFFH))
          THEN CF = 0; OF = 0;
          ELSE CF = 1; OF = 1;
        FI;
      FI;
    ELSE IF (NumberOfOperands = 2)
      THEN
        temp ← DEST × SRC (* signed multiplication; temp is double DEST size*)
        DEST ← DEST × SRC (* signed multiplication *)
        IF temp > DEST
          THEN CF = 1; OF = 1;
          ELSE CF = 0; OF = 0;
        FI;
      ELSE (* NumberOfOperands = 3 *)

```

IMUL—Signed Multiply (Continued)

```

DEST SRC1 □ SRC2 (* signed multiplication *)
temp SRC1 □ SRC2 (* signed multiplication; temp is double SRC1 size *)
IF temp □ DEST
    THEN CF 1; OF 1;
    ELSE CF 0; OF 0;
FI;
FI;
FI;

```

Flags Affected

For the one operand form of the instruction, the CF and OF flags are set when significant bits are carried into the upper half of the result and cleared when the result fits exactly in the lower half of the result. For the two- and three-operand forms of the instruction, the CF and OF flags are set when the result must be truncated to fit in the destination operand size and cleared when the result fits exactly in the destination operand size. The SF, ZF, AF, and PF flags are undefined.

Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a null segment selector.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

Real-Address Mode Exceptions

#GP	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS	If a memory operand effective address is outside the SS segment limit.

Virtual-8086 Mode Exceptions

#GP(0)	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made.

Description

Performs a signed multiplication of two operands. This instruction has three forms, depending on the number of operands.

- One-operand form.** This form is identical to that used by the MUL instruction. Here, the source operand (in a general-purpose register or memory location) is multiplied by the value in the AL, AX, or EAX register (depending on the operand size) and the product is stored in the AX, DX:AX, or EDX:EAX registers, respectively.
- Two-operand form.** With this form the destination operand (the first operand) is multiplied by the source operand (second operand). The destination operand is a general-purpose register and the source operand is an immediate value, a general-purpose register, or a memory location. The product is then stored in the destination operand location.
- Three-operand form.** This form requires a destination operand (the first operand) and two source operands (the second and the third operands). Here, the first source operand (which can be a general-purpose register or a memory location) is multiplied by the second source operand (an immediate value). The product is then stored in the destination operand (a general-purpose register).

When an immediate value is used as an operand, it is sign-extended to the length of the destination operand format.

IMUL—Signed Multiply (Continued)

The CF and OF flags are set when significant bits are carried into the upper half of the result. The CF and OF flags are cleared when the result fits exactly in the lower half of the result.

The three forms of the IMUL instruction are similar in that the length of the product is calculated to twice the length of the operands. With the one-operand form, the product is stored exactly in the destination. With the two- and three- operand forms, however, result is truncated to the length of the destination before it is stored in the destination register. Because of this truncation, the CF or OF flag should be tested to ensure that no significant bits are lost.

The two- and three-operand forms may also be used with unsigned operands because the lower half of the product is the same regardless if the operands are signed or unsigned. The CF and OF flags, however, cannot be used to determine if the upper half of the result is non-zero.

Operation

```

IF (NumberOfOperands = 1)
  THEN IF (OperandSize = 8)
    THEN
      AX ← AL × SRC (* signed multiplication *)
      IF ((AH = 00H) OR (AH = FFH))
        THEN CF = 0; OF = 0;
        ELSE CF = 1; OF = 1;
      FI;
    ELSE IF OperandSize = 16
      THEN
        DX:AX ← AX × SRC (* signed multiplication *)
        IF ((DX = 0000H) OR (DX = FFFFH))
          THEN CF = 0; OF = 0;
          ELSE CF = 1; OF = 1;
        FI;
      ELSE (* OperandSize = 32 *)
        EDX:EAX ← EAX × SRC (* signed multiplication *)
        IF ((EDX = 00000000H) OR (EDX = FFFFFFFFH))
          THEN CF = 0; OF = 0;
          ELSE CF = 1; OF = 1;
        FI;
      FI;
    ELSE IF (NumberOfOperands = 2)
      THEN
        temp ← DEST × SRC (* signed multiplication; temp is double DEST size*)
        DEST ← DEST × SRC (* signed multiplication *)
        IF temp > DEST
          THEN CF = 1; OF = 1;
          ELSE CF = 0; OF = 0;
        FI;
      ELSE (* NumberOfOperands = 3 *)

```

IMUL—Signed Multiply (Continued)

```

DEST SRC1 □ SRC2 (* signed multiplication *)
temp SRC1 □ SRC2 (* signed multiplication; temp is double SRC1 size *)
IF temp □ DEST
    THEN CF 1; OF 1;
    ELSE CF 0; OF 0;
FI;
FI;
FI;
```

Flags Affected

For the one operand form of the instruction, the CF and OF flags are set when significant bits are carried into the upper half of the result and cleared when the result fits exactly in the lower half of the result. For the two- and three-operand forms of the instruction, the CF and OF flags are set when the result must be truncated to fit in the destination operand size and cleared when the result fits exactly in the destination operand size. The SF, ZF, AF, and PF flags are undefined.

Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register is used to access memory and it contains a null segment selector.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made while the current privilege level is 3.

Real-Address Mode Exceptions

#GP	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS	If a memory operand effective address is outside the SS segment limit.

Virtual-8086 Mode Exceptions

#GP(0)	If a memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
#SS(0)	If a memory operand effective address is outside the SS segment limit.
#PF(fault-code)	If a page fault occurs.
#AC(0)	If alignment checking is enabled and an unaligned memory reference is made.

Indexed Addressing

- Operands of the form: $[ESI + ECX*4 + DISP]$
- ESI = Base Register
- ECX = Index Register
- 4 = Scale factor
- DISP = Displacement
- The operand is in memory
- The address of the memory location is
 $ESI + ECX*4 + DISP$

Figure 3-9. Offset (or Effective Address) Computation

The uses of general-purpose registers as base or index components are restricted in the following manner:

- The ESP register cannot be used as an index register.
- When the ESP or EBP register is used as the base, the SS segment is the default segment. In all other cases, the DS segment is the default segment.

The base, index, and displacement components can be used in any combination, and any of these components can be null. A scale factor may be used only when an index also is used. Each possible combination is useful for data structures commonly used by programmers in high-level languages and assembly language. The following addressing modes suggest uses for common combinations of address components.

Typical Uses for Indexed Addressing

- **Base + Displacement**

- ◇ access character in a string or field of a record
- ◇ access a local variable in function call stack

- **Index*Scale + Displacement**

- ◇ access items in an array where size of item is 2, 4 or 8 bytes

- **Base + Index + Displacement**

- ◇ access two dimensional array (displacement has address of array)
- ◇ access an array of records (displacement has offset of field in a record)

- **Base + (Index*Scale) + Displacement**

- ◇ access two dimensional array where size of item is 2, 4 or 8 bytes

Project 2: BSD Checksum

Due: Thursday September 30, 2004

Objective

The objective of this programming project is to practice designing your own loops and branching code in assembly language and to gain greater familiarity with the i386 instructions set.

Background

Checksums can be used to detect corrupted files. A file might be corrupted during transmission through a network or because the disk drive where the file is stored is damaged.

The BSD Checksum algorithm uses a 16-bit checksum. Initially, the value of the checksum is zero. For each byte of the file (in sequential order), the checksum is rotated 1 bit to the right and the byte is added to the checksum. The value of the checksum after the last byte of the file has been processed is the checksum of the file.

If the checksum of a file changes, then you know that its contents have been altered. However, it is possible for two different files to have the same checksum (since there are only 64K different values for a 16-bit checksum but many more possible files). So, having the same checksum does not guarantee that the file has not been corrupted. A well-designed checksum algorithm should be able to indicate the most common types of file corruption (e.g., transposed bits, single bits flipped).

Assignment

Write an assembly language program that computes the BSD checksum (algorithm given above) of the `stdin` file. You should output the checksum as a 16-bit binary number to `stdout`. The intention is for you to use Unix input/output redirection:

```
./a.out <ifile >ifile.checksum
```

The value of the checksum can be examined using the `hexdump` command.:

```
hexdump ifile.checksum
hexdump -e '1/2 "%u\n"' ifile.checksum
```

The first `hexdump` command gives the result in hexadecimal. The second `hexdump` command gives the value in decimal. (It is a challenge to alias the second command in Unix.)

Some details:

- Your program must read a block of bytes from the input. You should not read from the input one byte at a time. (It would be terribly inefficient).
- You may assume that when the operating system returns with 0 bytes read that the end of the input file has been reached.
- On the other hand, you may not assume that the end of the file has been reached when the operating system gives you fewer bytes than your block size.

Implementation Notes

- You can check your program using the `sum` command which prints out the BSD checksum of the file in decimal. (No, you may not call the Unix `sum` command from your program.)
- Look up the rotate right instruction in the Intel manual to make sure that you are using the correct rotate instruction.
- The BSD checksum algorithm involves adding an 8-bit value to a 16-bit value. Make sure you are doing this correctly.

- You will have two nested loops. The outer loop reads blocks from the input until the end of the file. The inner loop processes one character at a time. Decide ahead of time how the loops are controlled, which value is stored in which register or memory location.
- Record some sample runs of your program using the Unix script command.

Turning in your program

Use the UNIX `submit` command on the GL system to turn in your project. You should submit two files: 1) the assembly language program and 2) the typescript file of sample runs of your program. The class name for submit is `cs313_0101`. The name of the assignment name is `proj2`. The UNIX command to do this should look something like:

```
submit cs313_0101 proj2 checksum.asm typescript
```
