

# CMSC 313 Lecture 12

- **Project 3 Questions**
- **How C functions pass parameters**

# Last Time

- **Stack Instructions: PUSH, POP**
  - ◇ **PUSH** adds an item to the top of the stack
  - ◇ **POP** removes an item from the top of the stack
- **Subroutine Instructions: CALL, RET**
  - ◇ **CALL** saves EIP on the stack and jumps to the subroutine
  - ◇ **RET** retrieves the caller's EIP from the stack
- **Subroutine Examples**

# Linux/gcc/i386 Function Call Convention

- **Parameters pushed right to left on the stack**
  - ◇ first parameter on top of the stack
- **Caller saves EAX, ECX, EDX if needed**
  - ◇ these registers will probably be used by the callee
- **Callee saves EBX, ESI, EDI**
  - ◇ there is a good chance that the callee does not need these
- **EBP used as index register for parameters, local variables, and temporary storage**
- **Callee must restore caller's ESP and EBP**
- **Return value placed in EAX**

**A typical stack frame for the function call:**

```
int foo (int arg1, int arg2, int arg3) ;
```

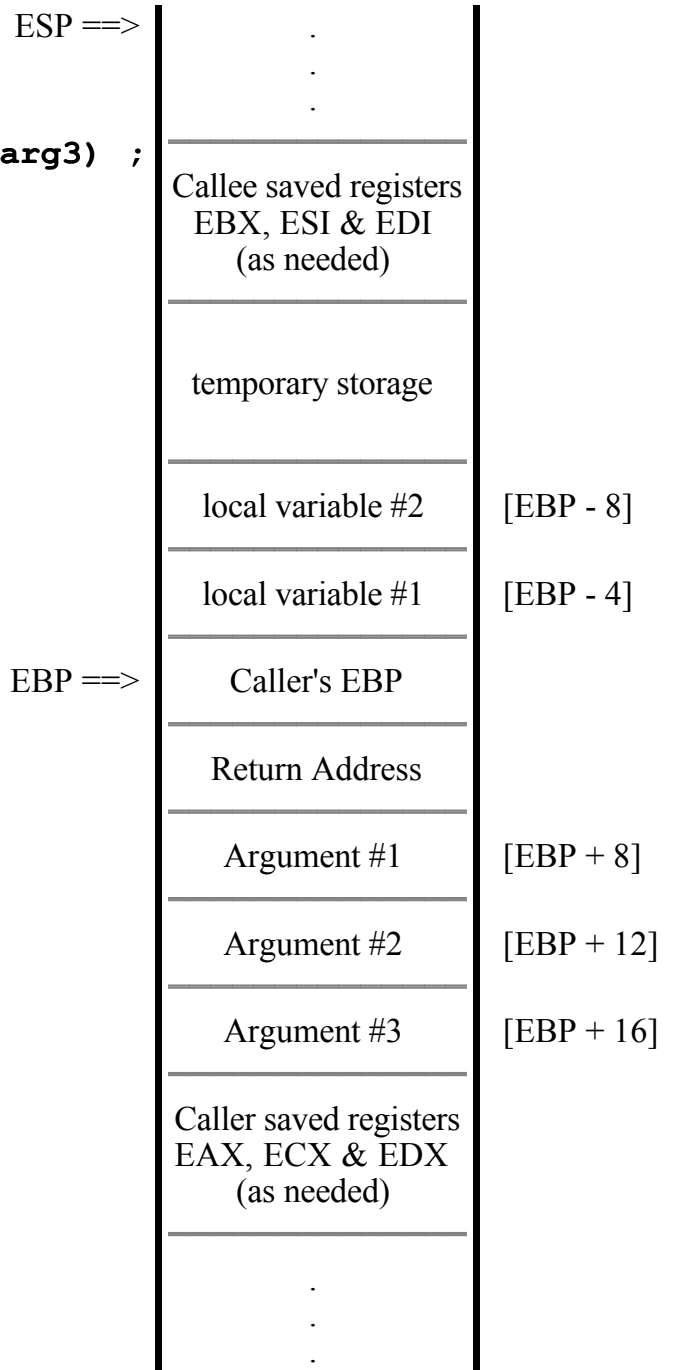

Fig. 1

## The caller's actions before the function call

- Save EAX, ECX, EDX registers as needed
- Push arguments, last first
- CALL the function

Fig. 2

## The callee's actions after function call

- Save main's EBP, set up own stack frame

```
push    ebp
mov     ebp, esp
```

- Allocate space for local variables and temporary storage
- Save EBX, ESI and EDI registers as needed

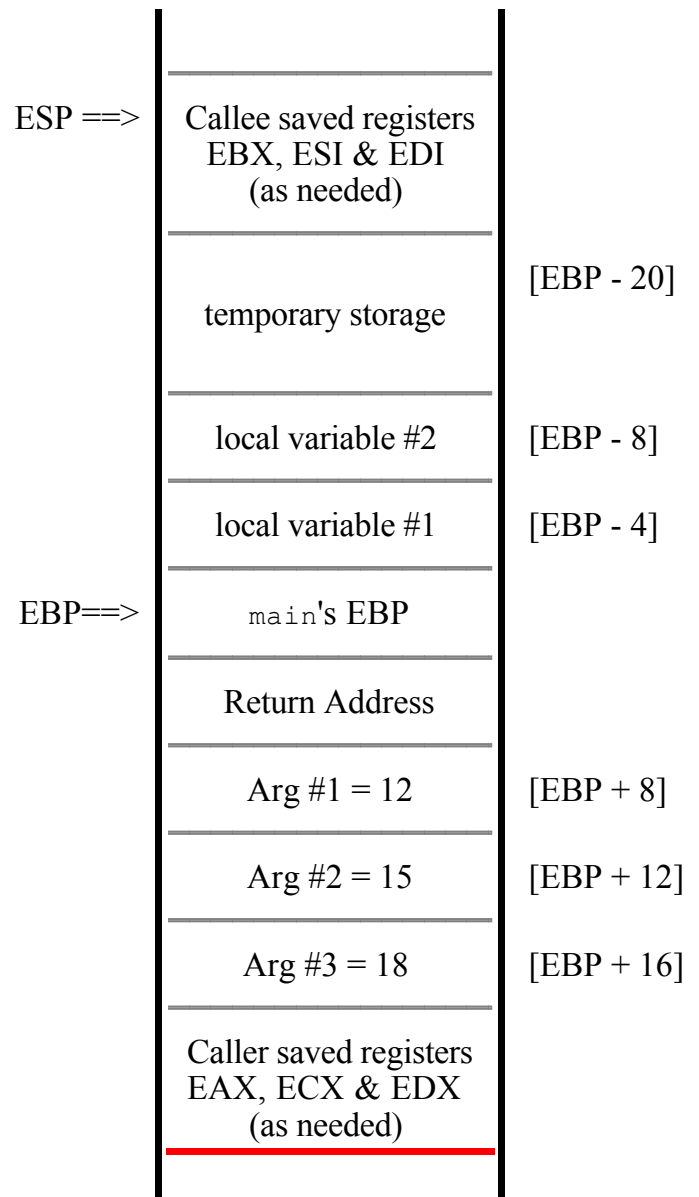

Fig. 4

## The callee's actions before returning

- Store return value in EAX
- Restore EBX, ESI and EDI registers as needed
- Restore main's stack frame

```
mov    esp, ebp
pop    ebp
```

- RET to main

Fig. 5

## The caller's actions after returning

- POP arguments off the stack
- Store return value in EAX
- Restore EAX, ECX and EDX registers as needed

Fig. 6

```
// File: cfunc.c
//
// Example of C function calls disassembled
//
```

```
#include <stdio.h>
```

```
// a silly function
```

```
//
int foo(int x, int y) {
```

```
    int z ;
```

```
    z = x + y ;
```

```
    return z ;
```

```
}
```

```
int main () {
```

```
    int b ;
```

```
    b = foo(35, 64) ;
```

```
    b = b + b ;
```

```
    printf ("b = %d\n", b) ;
```

```
}
```

---

```
linux3% gcc cfunc.c
```

```
linux3% a.out
```

```
b = 198
```

```
linux3%
```

```
linux3% gcc -S cfunc.c
```

```
linux3% i2g -g cfunc.s >cfunc.asm
```

```
linux3%
```

```
