FINITE STATE MACHINES

EXAMPLE:
MOD 4 COUNTER

Example: Modulo-4 Counter

- Counter has a clock input (CLK) and a RESET input.
- Counter has two output lines, which take on values of 00, 01, 10, and 11 on subsequent clock cycles.

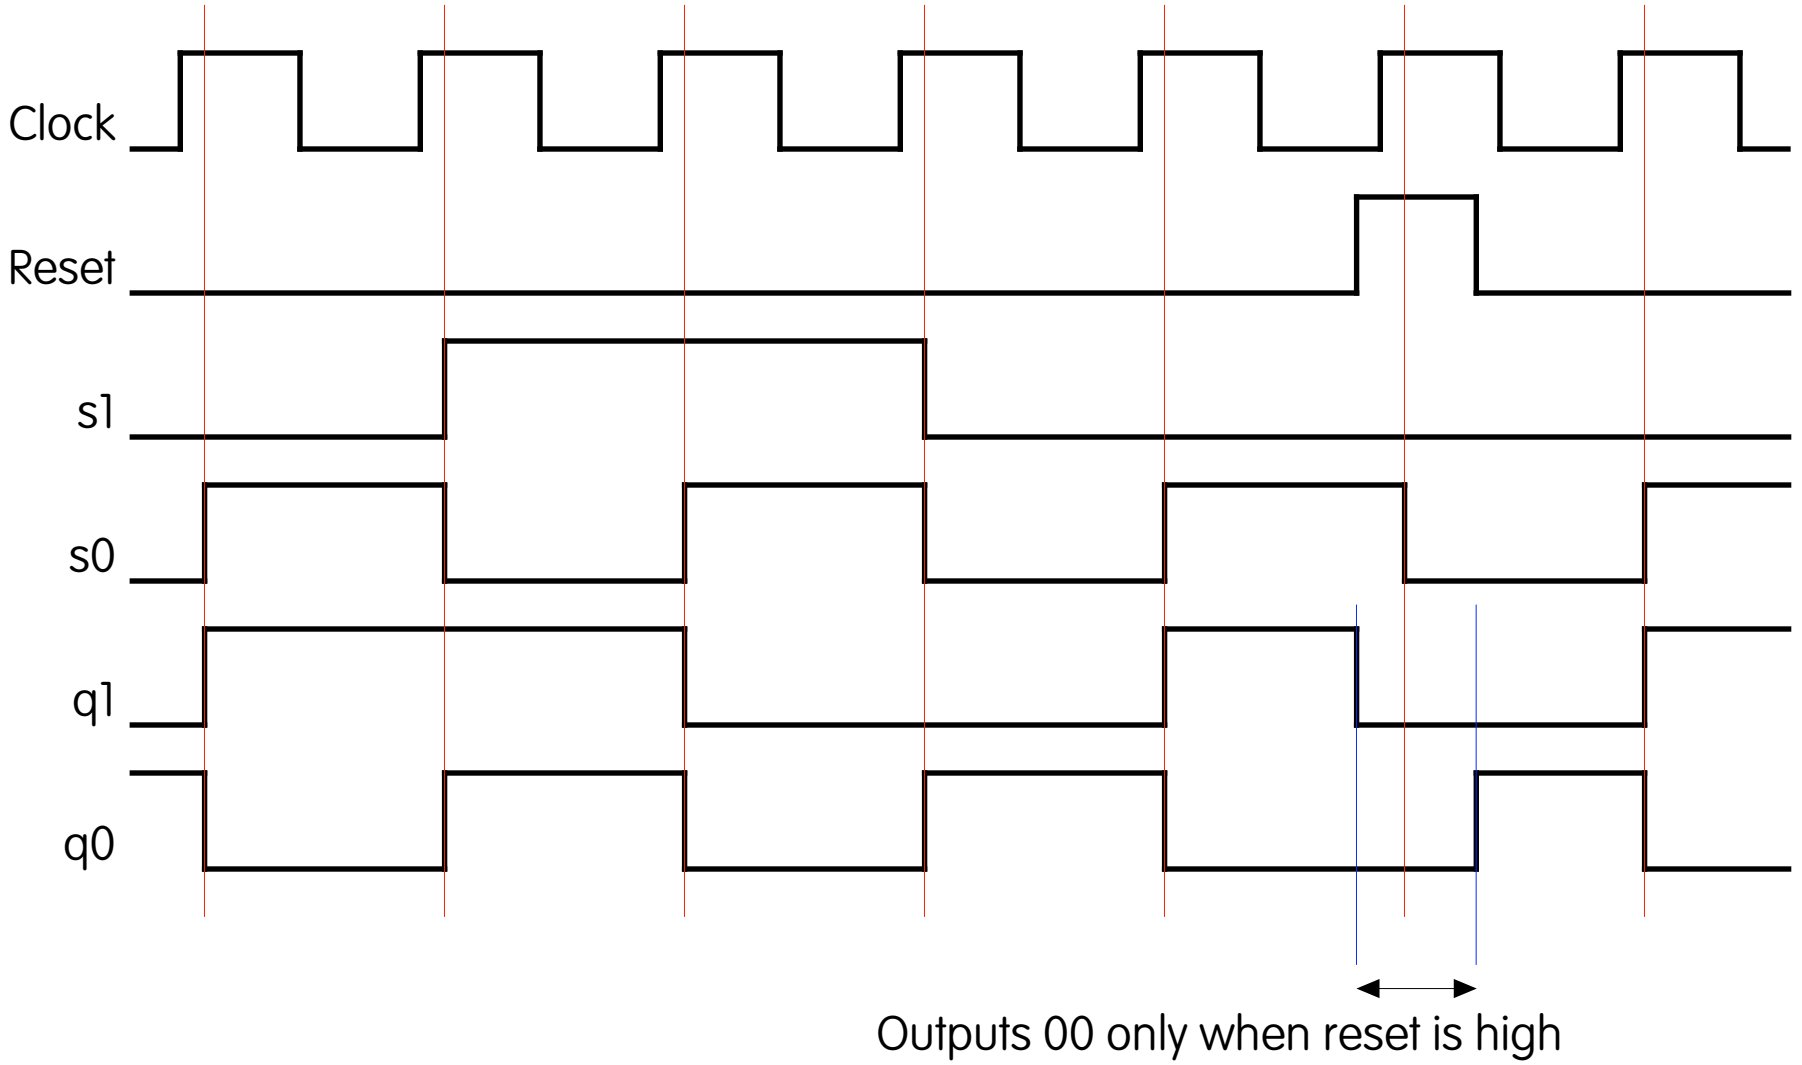
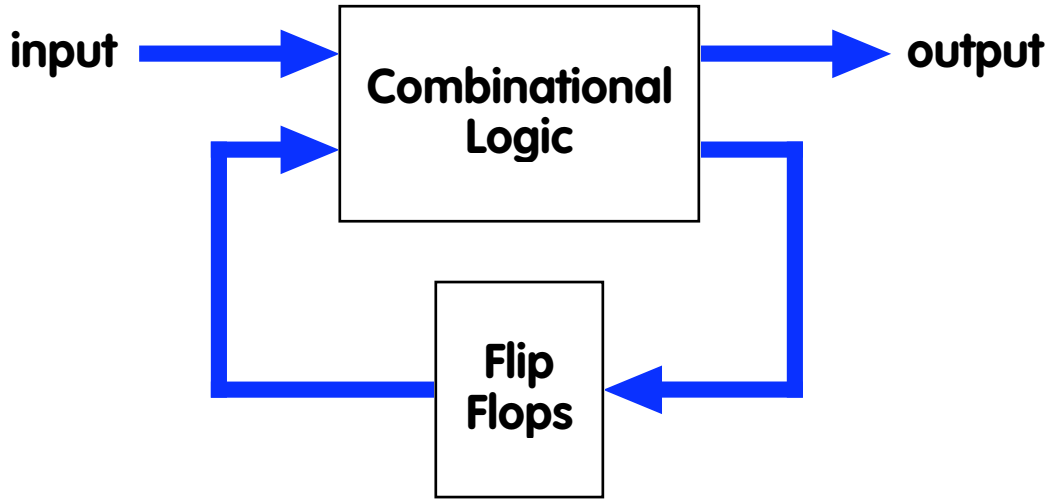
Mod 4 Counter Timing



Mealy vs Moore Finite State Machines

- **Mealy: output depends on input and state bits**



- **Moore: output depends only on state bits**

EXAMPLE: VENDING MACHINE

Example: A Vending Machine Controller

- **Example: Design a finite state machine for a vending machine controller that accepts nickels (5 cents each), dimes (10 cents each), and quarters (25 cents each). When the value of the money inserted equals or exceeds twenty cents, the machine vends the item and returns change if any, and waits for next transaction.**
- **Implement with PLA and D flip-flops.**
