BibTex and Annotated Bibliographies

Marie desJardins

February 5, 2004

1   BibTeX

BibTeX is a program that works in conjunction with LaTeX to produce inline citations and references. To use BibTeX, you need to create a ".bib" file that contains your bibliographic entries in BibTeX format. You use
`cite` (and variations thereof) to create inline citations and

```
\bibliographystyle{STYLE}
\bibliography{BIBFILE}
```

to produce the references section, where `STYLE` is the name of a BibTeX style file (i.e., STYLE.bst exists in your LaTeX search path), and `BIBFILE.bib` is your BibTeX file.

To produce a formatted LaTeX output file that includes citations and references, you must run `latex`, then `bibtex`, then `latex` *twice* to update all of the symbol table references. For example,

```
% latex sample-bib                              ;; processes sample-bib.tex
% bibtex sample-bib                             ;; processes sample-bib.bib
                                                ;; produces sample-bib.bbl

% latex sample-bib
% latex sample-bib
```

You now have a ".dvi" file that you can view and process just as you would with a regular latex output file.

We'll go over the specifics of BibTeX in class.

The best online source for BibTeX I've found is:

```
Oren Patashnik, ``BibTeXing,'' February 8, 1988,
http://citeseer.nj.nec.com/patashnik88bibtexing.html
```

2   Annotated Bibliographies

Your annotated bibliography is due on February 24. If you want to use BibTeX to produce this document, you can download the following files from the course website:

```
plain-annote.bst -- annotated bibliography style file or BibTeX
   (written and distributed online by Harvey J. Greenberg)
unsrt-annote.bst -- an unsorted version
bib-guidelines.tex -- the latex source for this handout
bib-guidelines.bib -- the associated bibtex file
```

The command

```
\nocite{*}
```

will include all of the references in your BibTeX file. Using

```
\bibliographystyle{plain-annote}
\bibliography{BIBFILE}
```

will produce a references section in annotated-bibliography format, using the `annote` field in the BibTeX entries for the annotations. (The references section in this handout were produced in this way.)

I haven't been able to find a BibTeX style file that will let you group references together and include section headers (as in Zobel's annotated bibliography on pp. 164–170). To get the section headers that you see in the annotated bibliography here, I explicitly listed all of the papers I wanted to use, in the order I wanted them to appear.

```
\nocite{boutilier97,boutilier01,bacchus96,cohen01}
```

I used the unsrt-annote.bst BibTeX style file, then edited the `bib-guidelines.bbl` file (which BibTeX produces) manually, *after* running BibTeX. Each section header is produced by the line

```
\subsection*{SECTION HEADER}
```

just before the first
`bibitem` entry for that section. This isn't a very pretty solution, because every time you change your BibTeX database and re-run BibTeX, you have to edit the `.bbl` file again. But it works. (Obviously, your section headers should be more semantically meaningful than mine...)
